

zodiac

zodiac, in astronomy and astrology, a belt of the heavens extending 9° on either side of the ecliptic, the plane of Earth's orbit and of the Sun's apparent annual path. The orbits of the planets and of the principal planets also lie within the zodiac. The 12 astrological signs of the zodiac are each considered to be 1/12 (or 30°) of its great circle. The signs no longer correspond to the astronomical constellations in which the Sun appears. The constellations vary in size and shape, and the ecliptic passes through one constellation (Ophiuchus) that is not considered a member of the zodiac.
